Event status	Self-declaration	
On-going	No	

General information

Country or zone - Country	Disease - SARS-CoV-2 in animals (Inf. with)	Started on - 22/10/2020
Animal type - Terrestrial	Confirmed on - 13/04/2021	Causal agent - SARS-CoV-2
Disease category - Emerging	Reported on - 12/02/2021	Reason - Emerging disease

Disease impact

Outbreak morbidity - 2.0	Outbreak mortality - 1.0
Zoonotic potential - Yes	Zoonotic potential description - Zoonotic potential under investigation

Epidemiology

Source of the event or origin of the infection - Suspected human transmission

Epidemiological comments 11 Feb 2021 Update: Texas (TX): A domestic dog from a known positive COVID-19 household was confirmed positive for SARS-CoV-2 at the National Veterinary Services Laboratories (NVSL) based upon molecular testing (PCR and sequencing). The affected dog showed no clinical signs. Other pets (dog, cats and rabbit) residing in the same household showed no clinical signs and tested negative for SARS-CoV-2. Samples for these cases were collected as part of planned and targeted active surveillance of a specific animal, with known or suspected exposures to a person with COVID-19 or other exposure to SARS-CoV-2, to better understand risk factors for SARS-CoV-2 transmission. California (CA): A domestic cat from a known positive COVID-19 household was confirmed positive for SARS-CoV-2 at the NVSL based upon molecular testing (PCR and sequencing). The affected cat exhibited mild respiratory clinical signs that have since reportedly resolved. Two dogs residing in the same household showed no clinical signs. Florida (FL): A domestic cat from a known positive COVID-19 household was confirmed positive for SARS-CoV-2 at the NVSL based upon molecular sequencing. The affected cat exhibited clinical signs of coughing, conjunctivitis and nasal discharge. Indiana (IN): A Malayan tiger at a zoo was confirmed positive for SARS-CoV-2 at the NVSL based upon molecular testing (PCR and sequencing). The affected tiger exhibited a dry cough. A second tiger, who showed inappetence, was sampled and is presumed positive for SARS-CoV-2. It is likely that the SARS-CoV-2 virus was transmitted to the tigers by an infected human. Both tigers are progressively recovering. The zoo is closed to the public and increased biosecurity measures have been implemented. Virus neutralizing antibodies in the absence of other positive test results have been detected in the following animals (listed by state): 1 dog (TX) As of 11 Feb 2021, total number of animals with detections of virus neutralizing antibody in the absence of other positive test results: 58 There is a single SARS-CoV-2 event occurrence in the United States of America, however, for WAHIS technical reasons, any new outbreak in the country will be reported in this new event and not in the one first reported in April 2020.

Control measures at event level

Domestic control measures

Applied

- Quarantine
- Disinfection

Wild control measures

Applied

- Quarantine

Diagnostic

Clinical signs - No

Method of diagnostic - Diagnostic test

Test name	Category	Test type	Laboratory	Species sampled	Outbreaks	Tested from	Tested until	Result
Real-time reverse transcription polymerase chain reaction (rRT-PCR)	Nucleic acid detection	Laboratory Test	National Veterinary Services Laboratories	Cats		16/11/2020		Positive
