General information

| | | |
|-----------------------------|---|---------------------------|
| Country or zone - Country | Disease - SARS-CoV-2 in animals (Inf. with) | Started on - 22/10/2020 |
| Animal type - Terrestrial | Confirmed on - 13/04/2021 | Causal agent - SARS-CoV-2 |
| Disease category - Emerging | Reported on - 28/10/2021 | Reason - Emerging disease |

Disease impact

| | |
|--------------------------|---|
| Outbreak morbidity - 2.0 | Outbreak mortality - 1.0 |
| Zoonotic potential - Yes | Zoonotic potential description - Zoonotic potential under investigation |

Epidemiology

Source of the event or origin of the infection - Suspected human transmission

Epidemiological comments--Update 28 October 2021

Hawaii (HI): Two lions at a zoo were confirmed positive for SARS-CoV-2 at the National Veterinary Services Laboratories (NVSL) based upon molecular testing (PCR and sequencing). The affected animals exhibited clinical signs, including coughing, sneezing with mucoid discharge, lethargy and inappetence. One lion's illness quick progressed leading to respiratory failure and death. This represents a new state with detection of a positive SARS-CoV-2 animal, but not a new species for the U.S.

South Dakota (SD): Three tigers and two snow leopards at a zoo were confirmed positive for SARS-CoV-2 at the National Veterinary Services Laboratories (NVSL) based upon molecular testing (PCR and sequencing). The affected animals showed clinical signs include cough, lethargy, diarrhea, and decreased appetite. One snow leopard died and will be necropsied to determine the cause of death. The other affected animals have recovered. The big cat displays have been closed to the public. This represents a new state with detection of a positive SARS-CoV-2 animal, but not a new species for the U.S.

Nebraska (NE): A snow leopard at a zoo was confirmed positive for SARS-CoV-2 at the National Veterinary Services Laboratories (NVSL) based upon molecular testing (PCR and sequencing). The confirmed animal, and two other snow leopards and two tigers, exhibited clinical signs, including cough, shortness of breath, nasal discharge, lethargy, and decreased appetite. Control measures included isolation and quarantine, cleaning and disinfection. This represents a new state with detection of a positive SARS-CoV-2 animal, but not a new species for the U.S.

Colorado (CO): Eleven lions and two tigers at a zoo were confirmed positive for SARS-CoV-2 at the National Veterinary Services Laboratories (NVSL) based upon molecular testing (PCR and sequencing). The affected animals exhibited clinical signs, including coughing, sneezing, lethargy, decreased appetite, ocular and nasal discharge. Control measures included quarantine, cleaning and disinfection, and plans to vaccinate lions and tigers at the zoo. This represents a new state with detection of a positive SARS-CoV-2 animal, but not a new species for the U.S.

There is a single SARS-CoV-2 event occurrence in the United States of America, however, for WAHIS technical reasons, any new outbreaks in the country will be reported in this new event and not in the one first reported in April 2020.

For more details about SARS-CoV-2 testing of animals in the United States, see:
<https://www.aphis.usda.gov/aphis/dashboards/tableau/sars-dashboard>.

Diagnostic

Clinical signs - Yes

Method of diagnostic - Diagnostic test

| Test name | Category | Test type | Laboratory | Species sampled | Outbreaks | Tested from | Tested until | Result |
