

Follow-up report 22

28/09/2021

The event is ongoing. Weekly follow-up reports will be submitted.

Sender	Country/territory	Report ID
Delegate of United States of America	United States of America	FUR_151828
Event status	Self-declaration	
On-going	No	

General information

Country or zone - Country	Disease - SARS-CoV-2 in animals (Inf. with)	Started on - 22/10/2020
Animal type - Terrestrial	Confirmed on - 13/04/2021	Causal agent - SARS-CoV-2
Disease category - Emerging	Reported on - 28/09/2021	Reason - Emerging disease

Disease impact

Outbreak morbidity - 2.0	Outbreak mortality - 1.0
Zoonotic potential - Yes	Zoonotic potential description - Zoonotic potential under investigation

Epidemiology

Source of the event or origin of the infection - Suspected human transmission

Epidemiological comments--Update 27 Sep 2021

New Jersey (NJ): A domestic dog was confirmed positive for SARS-CoV-2 at the National Veterinary Services Laboratories (NVSL) based upon molecular testing (PCR and sequencing). The dog presented to the veterinarian with lethargy, inappetence, fever, coughing, and shortness of breath. The following day, the animal went into cardiac arrest and could not be resuscitated.

There are no known cases of COVID-19 in the owners or caretakers of this dog. The dog had recently returned home from a stay at a boarding facility. Though no known outbreaks of illness in humans or animals were reported by the kennel prior to or at the time of the affected dog's stay, the facility has increased cleaning protocols.

District of Columbia (DC): A tiger and lion at a zoo were confirmed positive for SARS-CoV-2 at the NVSL based upon molecular testing (PCR and sequencing).

The affected animals exhibited clinical signs, including coughing, lethargy, fever and inappetence. Several other tigers and lions housed in the same building as the affected animals have also started displaying clinical signs.

It is likely that the SARS-CoV-2 virus was transmitted to the tigers and lions by an infected human. Symptomatic animals are being treated supportively, and the zoo has increased biosecurity measures.

Florida (FL): A domestic ferret from a known positive COVID-19 household was confirmed positive for SARS-CoV-2 at the NVSL based upon molecular testing (PCR and sequencing). The ferret displayed clinical signs of coughing and sneezing.

A second ferret residing in the same household has not shown clinical signs.

There is a single SARS-CoV-2 event occurrence in the United States of America, however, for WAHIS technical reasons, any new outbreaks in the country will be reported in this new event and not in the one first reported in April 2020.

For more details about SARS-CoV-2 testing of animals in the United States, see:

<https://www.aphis.usda.gov/aphis/dashboards/tableau/sars-dash-board>.

Diagnostic

Clinical signs - Yes

Method of diagnostic - Diagnostic test
