

Follow-up report 10

22/03/2021

The event is ongoing. Weekly follow-up reports will be submitted.

Sender	Country/territory	Report ID
Delegate of United States of America	United States of America	FUR_149057
Event status	Self-declaration	
On-going	No	

General information

Country or zone - Country	Disease - SARS-CoV-2 in animals (Inf. with)	Started on - 22/10/2020
Animal type - Terrestrial	Confirmed on - 13/04/2021	Causal agent - SARS-CoV-2
Disease category - Emerging	Reported on - 22/03/2021	Reason - Emerging disease

Disease impact

Outbreak morbidity - 2.0	Outbreak mortality - 1.0
Zoonotic potential - Yes	Zoonotic potential description - Zoonotic potential under investigation

Epidemiology

Source of the event or origin of the infection - Suspected human transmission

Epidemiological comments Alabama (AL): A domestic cat from a known positive COVID-19 household was confirmed positive for SARS-CoV-2 at the NVSL based upon molecular testing (PCR and sequencing). The affected cat exhibited clinical signs of fever, coughing, dyspnea, sneezing, lethargy and nasal discharge. Another cat and dog in the household did not show clinical signs.

Texas (TX): A domestic cat was confirmed positive for SARS-CoV-2 at the NVSL based upon molecular testing (PCR and sequencing).

Arizona (AZ): A domestic cat from a suspected positive COVID-19 household was confirmed positive for SARS-CoV-2 at the NVSL based upon molecular testing (sequencing). The affected cat exhibited clinical signs of nasal discharge, sneezing, lethargy and anorexia.

Connecticut (CT): A domestic cat from a known positive COVID-19 household was confirmed positive for SARS-CoV-2 at the NVSL based upon molecular testing (sequencing). The affected cat exhibited clinical signs of sneezing, cough, mild nasal discharge and mild lethargy.

Texas (TX): A lion from a previously reported zoo was confirmed positive for SARS-CoV-2 at the NVSL based upon molecular testing (PCR and sequencing).

Texas (TX): A domestic cat was confirmed positive for SARS-CoV-2 at the NVSL based on molecular testing (PCR and sequencing).

Illinois (IL): A domestic cat from a known positive COVID-19 household was confirmed positive for SARS-CoV-2 at the NVSL based upon molecular testing (PCR and sequencing). The affected cat exhibited clinical signs of shortness of breath, fatigue, fever, nasal

and eye discharge and wheezing. The cat has diabetes and was hypoglycemic. Three other cats in the household did not show clinical signs.

Arkansas (AR): A domestic cat from a known positive COVID-19 household was confirmed positive for SARS-CoV-2 at the NVSL based upon molecular testing (PCR and sequencing). The cat had no clinical signs and died acutely six days after being taken to a shelter. Two additional dogs from the household did not display any clinical signs but tested positive for SARS-CoV-2 neutralizing

antibodies.

Connecticut (CT): A 3-month-old domestic dog from a household with unknown COVID-19 status was confirmed positive for SARS-CoV-2 at the NVSL based upon molecular testing (PCR and sequencing). The puppy died suddenly on 12 February 2021, with no signs of illness. Necropsy results indicated cardiac failure as most likely cause of death.

Indiana (IN): A tiger from a previously reported zoo was confirmed positive for SARS-CoV-2 at the NVSL based upon molecular testing (PCR and sequencing).

Connecticut (CT): A domestic dog from a known positive COVID-19 household was confirmed positive for SARS-CoV-2 at the NVSL based upon molecular testing (PCR and sequencing). The animal was euthanized due to clinical signs including anorexia, lethargy and tachypnea. There are two additional dogs in the household. Both animals are asymptomatic and apparently healthy.

New Jersey (NJ): A domestic cat from a known positive COVID-19 household was confirmed positive for SARS-CoV-2 at the NVSL based upon molecular testing (PCR and sequencing). The animal was euthanized due to clinical signs including hypothermia, dyspnea, crackles, wheeze, and copious amounts of nasal and ocular discharge. This animal had known mild stage 1 renal disease and was hyperthyroid. There is an additional cat in the household that was asymptomatic and appeared healthy.

Texas (TX): A domestic dog and cat from a known positive COVID-19 household were confirmed positive for SARS-CoV-2 at the National Veterinary Services Laboratories (NVSL) based upon molecular testing (PCR and sequencing). Neither animal showed any sign of illness at the time of their positive tests. Samples for these cases were collected as part of planned and targeted active surveillance of a specific animal, with known or suspected exposures to a person with COVID-19 or other exposure to SARS-CoV-2, to better understand risk factors for SARS-CoV-2 transmission.

Virus neutralizing antibodies in the absence of other positive test results have been detected in the following animals (listed by state):

2 Tigers (TX)

2 Dogs (AR)

As of 15 March 2021, total number of animals with detections of virus neutralizing antibody in the absence of other positive test results: 63

There is a single SARS-CoV-2 event occurrence in the United States of America, however, for WAHIS technical reasons, any new outbreaks in the country will be reported in this new event and not in the one first reported in April 2020.

Control measures at event level

Domestic control measures

Applied

- Quarantine
- Disinfection

Wild control measures

Applied

- Quarantine
- Disinfection

Diagnostic

Clinical signs - Yes

Method of diagnostic - Diagnostic test
